

Project Testing Phase

Date	29.09.2026
Team ID	6ab226e418c4954598225b32
Project Name	Auto Ticket Classification using Flow Designer

1. Brainstorming & Ideation Phase :

Problem Statement :

The school IT helpdesk receives many incident requests daily from students and teachers, such as Wi-Fi issues, projector failures, password problems and slow computers. IT staff manually read each request and assign a category, which is time-consuming, error-prone and not scalable.

Ideas Considered :

- Manual classification by IT agents (current approach, inefficient).
- Business Rule with server-side script (needs coding, harder to maintain).
- Machine learning / Predictive Intelligence (too complex for a small school).
- Flow Designer keyword-based automation (selected): no-code, easy to maintain and quick to build.

Proposed Solution :

Automatically classify a ticket at creation time by checking keywords in the Short Description, set the Category and Subcategory, and email a confirmation to the caller.

Objectives :

- Automatically classify incidents at the time of creation.
- Reduce manual effort for IT agents.
- Improve ticket routing efficiency.
- Implement a no-code, easily maintainable solution.
